

[PLATFORM OVERVIEW](#)

Network Flow Intelligence for Modern Infrastructure

pktFlow is a self-hosted, real-time NetFlow analytics platform that transforms raw network telemetry into actionable intelligence — delivered through a fast, modern web dashboard.

What Is pktFlow?

pktFlow is a complete network flow visibility solution. It collects NetFlow v9 telemetry from your routers and switches, processes and stores it at scale, and presents it through an interactive browser-based dashboard — with no cloud dependency, no per-seat licensing, and no data leaving your infrastructure.

Whether you need to troubleshoot a performance issue, investigate suspicious traffic, meet compliance reporting requirements, or simply understand how your network is being used, pktFlow provides the visibility you need.

Key Capabilities

Real-Time Dashboard	Live traffic charts, top talkers, protocol breakdown, and per-site throughput — all from live NetFlow data.
Flow Explorer	Search and filter individual flow records by IP, port, protocol, time range, and site. Export as CSV or JSON.
Topology Map	D3-powered interactive network graph showing which devices are communicating and with what intensity.
Alert Engine	Rule-based alerting for data gaps, new hosts, rate spikes, and protocol anomalies with notification support.
High-Performance Storage	ClickHouse columnar database delivers sub-second query response across billions of stored flow records.
Role-Based Access	Admin, Analyst, and Viewer roles with JWT authentication and per-endpoint enforcement.
Multi-Site Collection	Receive flows from multiple collector nodes across network segments, tagged by site for easy filtering.

How It Works — The Data Pipeline

pktFlow uses a five-stage pipeline to take raw network packets from your routers and deliver analytics to your browser:

Technology Stack

Who Uses pktFlow

Network Analysts

Use the Flow Explorer and Dashboard to investigate traffic patterns, identify top bandwidth consumers, and trace suspicious connections.

IT Operations

Monitor ingest health, configure alert rules, manage users, and maintain the platform. Full admin API for automation.

Security Teams

Use new-host alerts, protocol anomaly detection, and the full flow record history to detect and investigate security incidents.

pktFlow — Network Flow Intelligence Platform

Self-Hosted · Open Infrastructure · No SaaS Required
