VIEWER ROLE

Viewer Guide

pktLog v1.0 · Read-only dashboard access

Role Overview

The **Viewer** role provides read-only access to the pktLog dashboard, log browser, and alert events. Viewers can see what is happening across the network's syslog infrastructure but cannot export data, acknowledge alerts, or change any configuration.

If you need to export data or investigate an event in depth, ask your administrator to upgrade your account to the Analyst role.

Logging In

Navigate to the pktLog URL provided by your administrator. Enter your username and password. Your session will remain active for the duration set by your admin (typically 8 hours). If you cannot log in or your account is inactive, contact your pktLog administrator.

Dashboard

After logging in you arrive at the **Dashboard** — a real-time overview of all syslog activity.

Widget	What It Shows
Events/sec	How many log messages are arriving right now
Events Today	Total messages received since midnight
Severity Breakdown	Distribution of message severity levels
Volume Chart	Event volume over time — spikes indicate unusual activity
Top Hosts	Which devices are generating the most log messages
Active Alerts	Count of open alert events requiring analyst attention
Collector Status	Whether log collection from each site is healthy

The dashboard refreshes automatically — no manual reload needed.

Browsing Logs

Navigate to: Logs

The Logs page shows a paginated table of syslog events, most recent first. You can scroll through pages and click any row to expand it and see the full event details including the original raw syslog line.

As a Viewer you can use the **time range selector** and basic filters (host, severity) to narrow what you see. You cannot export results.

Note: To download log data for reporting or investigation, ask an Analyst to perform the export on your behalf.

Viewing Alerts

Navigate to: Alerts

The Alerts page shows all fired alert events and their current status. As a Viewer you can read alerts to understand what conditions have been detected, but you cannot acknowledge or resolve them — those actions are for Analysts and Admins.

If you see an alert you believe requires immediate attention, notify an Analyst or Administrator directly.

Syslog Severity Reference

Level	Meaning	Common Examples
Emergency (0)	System unusable	Kernel panic, power failure
Alert (1)	Immediate action required	Data corruption detected
Critical (2)	Critical conditions	Hardware failure, disk full
Error (3)	Error conditions	Authentication failure, service crash
Warning (4)	Warning conditions	Disk space low, configuration change
Notice (5)	Normal but significant	Service start/stop, user login
Info (6)	Informational	Routine operational events
Debug (7)	Detailed tracing	Application debug output

What to watch for: Healthy systems show mostly **Info** and **Notice** events. A sudden increase in **Error**, **Critical**, or **Emergency** messages typically indicates a problem worth escalating to an Analyst.

Viewer Access Summary

Feature	Viewer Access
View dashboard widgets	✔ Full access
Browse log events	✔ Full read access
View alert events	✔ Read only
Filter logs by time / host / severity	✔ Basic filters
Export log data (CSV/JSON)	✘ Analyst or Admin only
Acknowledge or resolve alerts	✘ Analyst or Admin only
Manage users or platform settings	✘ Admin only
Configure alert rules	✘ Admin only

To gain additional capabilities, contact your pktLog administrator to have your account role updated.
